

# Compliance Label Sets

**Application Engineering Bulletin**

**June 2003**

Many times you have several different regulatory labels that need to be applied to one product. A designer considers each regulatory issue and labeling issue and generates the label requirement for each agency. Many times, if labeling is considered as a set of labels, there is a distinct cost advantage. Instead of having several different part numbers for different labels, there is a single part number in inventory for a set of labels to be put on the assembled product. A consideration for the label design stability should be taken, however, because changes in the number or configuration could generate additional costs for tooling, art, and the purging of label sets from stock.

If color is involved, making labels in sets can cut down manufacturing costs even further. Set production allows for colored logos to be utilized on multiple labels for more corporate identification without generating extra cost.

When designing a label set, it is also the time to see if some labeling requirements can be combined on a single label. For example, can the FCC regulation number, a product ID and a CE logo all be combined on a single label?

In small quantity orders, sets can reduce overall costs, instead of paying set up charges several times on different labels, they are only paid on the one label set. The cost of the special die and art charge is many times easily saved in the first run of the set. In addition, future product lines may have the same label size configurations, which will save future tooling costs for regulatory labels.
